EUREKA MATHTIPS FOR PARENTS

KEY CONCEPT OVERVIEW

Lessons 16 through 18 focus on strategies to help students solve division problems of multi-digit numbers.

You can expect to see homework that asks your child to do the following:

• Rewrite division problems as easier problems, and then solve. For example,

$$12,000 \div 300$$

$$= 12,000 \div 100 \div 3$$

$$= 120 \div 3$$

=40

• Estimate the **quotient**. For example,

$$609 \div 24$$

$$\approx 600 \div 20$$

= 30

• Solve word problems that involve division of multi-digit numbers.

SAMPLE PROBLEM (From Lesson 18)

Estimate the quotient.

$$\approx$$
 5,600 \div 70

$$= 560 \div 7$$

=80

Additional sample problems with detailed answer steps are found in the Eureka Math Homework Helpers books. Learn more at GreatMinds.org.

HOW YOU CAN HELP AT HOME

- Play a skip-counting contest with your child. For example, count by 3's to 30: 3, 6, 9, 12, 15, Count by 30's to 300: 30, 60, 90, 120, 150, Count by 300's to 3,000: 300, 600, 900, 1200, 1500,
- Play the Rounding card game with your child.
 - 1. Take the jacks, queens, kings, tens, and jokers out of the deck.
 - 2. Put the stack of remaining cards facedown.
 - 3. Flip a set number of cards and have your child practice rounding the number represented by the flipped cards to different place value units.

For example, you flip a 6, a 1, an 8, and a 2; they represent 6,182. Rounding 6,182 to the nearest ten is 6,180; rounding 6,182 to the nearest hundred is 6,200; and rounding 6,182 to the nearest thousand is 6,000.

Quotient: The answer resulting from the division of two numbers. For example, in $5.4 \div 6 = 0.9$, the number 0.9 is the quotient.
